Next item →

- 1. Suppose your training examples are sentences (sequences of words). Which of the following refers to the j^{th} word in the i^{th} training example?
 - $x^{(i) < j > }$
 - $\bigcap x^{< i > (j)}$
 - $\bigcirc \ x^{(j) < i>}$
 - $\bigcap x^{< j > (i)}$
 - **⊘** Correct

We index into the i^{th} row first to get the i^{th} training example (represented by parentheses), then the j^{th} column to get the j^{th} word (represented by the brackets).

2. Consider this RNN:

⊘ Correct

It is appropriate when every input should have an output.

3. To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply).

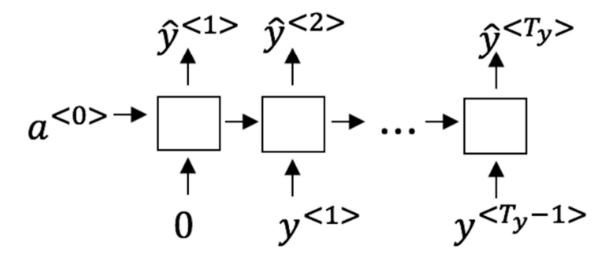

$$a^{<0>} \longrightarrow \begin{bmatrix} \hat{y} \\ \uparrow \\ \uparrow \\ \uparrow \\ \chi^{<1>} \chi^{<2>} \end{bmatrix} \longrightarrow \cdots \longrightarrow \begin{bmatrix} \hat{y} \\ \uparrow \\ \uparrow \\ \chi^{} \end{bmatrix}$$

- Speech recognition (input an audio clip and output a transcript)
 ✓ Sentiment classification (input a piece of text and output a 0/1 to denote positive or negative sentiment)
 ✓ Correct

 Correct!

 Image classification (input an image and output a label)
 ✓ Gender recognition from speech (input an audio clip and output a label indicating the speaker's gender)
 ✓ Correct

 Correct
 Correct
- 4. Using this as the training model below, answer the following:

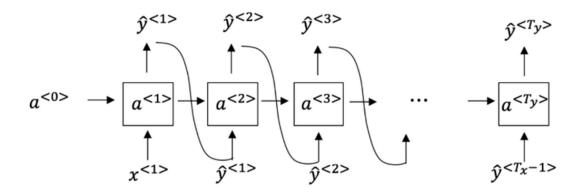

True/False: At the t^{th} time step the RNN is estimating $P(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \dots, y^{< t-1>})$

- True
- O False
 - **⊘** Correct

Yes, in a training model we try to predict the next step based on knowledge of all prior steps.

5. You have finished training a language model RNN and are using it to sample random sentences, as follows:

True/False: In this sample sentence, step t uses the probabilities output by the RNN to pick the highest probability word for that time-step. Then it passes the ground-truth word from the training set to the next time-step.

- False
- O True

⊘ Correct

The probabilities output by the RNN are not used to pick the highest probability word and the ground-truth word from the training set is not the input to the next time-step.

- 6. True/False: If you are training an RNN model, and find that your weights and activations are all taking on the value of NaN ("Not a Number") then you have an exploding gradient problem.
 - True
 - False

⊘ Correct

Correct! Exploding gradients happen when large error gradients accumulate and result in very large updates to the NN model weights during training. These weights can become too large and cause an overflow, identified as NaN.

- 7. Suppose you are training an LSTM. You have a 50000 word vocabulary, and are using an LSTM with 500-dimensional activations $a^{< t>}$. What is the dimension of Γ_u at each time step?
 - O 5
 - O 200
 - 500
 - 50000

○ Correct

Correct, Γ_u is a vector of dimension equal to the number of hidden units in the LSTM.

8. Sarah proposes to simplify the GRU by always removing the Γu. I.e., setting Γu = 0. Ashely proposes to simplify the GRU by removing the Γr. I. e., setting Γr = 1 always. Which of these models is more likely to work without vanishing gradient problems even when trained on very long input sequences?

GRU

$$\tilde{c}^{< t>} = \tanh(W_c[\Gamma_r * c^{< t-1>}, x^{< t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[c^{< t-1>}, x^{< t>}] + b_u)$$

$$\Gamma_r = \sigma(W_r[c^{< t-1>}, x^{< t>}] + b_r)$$

$$c^{< t>} = \Gamma_u * \tilde{c}^{< t>} + (1 - \Gamma_u) * c^{< t-1>}$$

$$a^{< t>} = c^{< t>}$$

- Ashely's model (removing Γr), because if Γu≈0 for a timestep, the gradient can propagate back through that timestep without much decay.
- Sarah's model (removing \(\Gamma\)u), because if \(\Gamma\) ≈ 0 for a timestep, the gradient can propagate back through that timestep without much decay.
- Ashely's model (removing Γr), because if Γu≈1 for a timestep, the gradient can propagate back through that timestep without much decay.
- Sarah's model (removing Γu), because if Γr≈1 for a timestep, the gradient can propagate back through that timestep without much decay.
- **⊘** Correct

Yes. For the signal to backpropagate without vanishing, we need $c^{< t>}$ to be highly dependent on $c^{< t-1>}$.

9. Here are the equations for the GRU and the LSTM:

GRU

LSTM

$$\tilde{c}^{< t>} = \tanh(W_c[\Gamma_r * c^{< t-1>}, x^{< t>}] + b_c) \qquad \qquad \tilde{c}^{< t>} = \tanh(W_c[a^{< t-1>}, x^{< t>}] + b_c)$$

$$\Gamma_u = \sigma(W_u[c^{< t-1>}, x^{< t>}] + b_u) \qquad \qquad \Gamma_u = \sigma(W_u[a^{< t-1>}, x^{< t>}] + b_u)$$

$$\Gamma_r = \sigma(W_r[c^{< t-1>}, x^{< t>}] + b_r) \qquad \qquad \Gamma_f = \sigma(W_f[a^{< t-1>}, x^{< t>}] + b_f)$$

$$c^{< t>} = \Gamma_u * \tilde{c}^{< t>} + (1 - \Gamma_u) * c^{< t-1>} \qquad \qquad \Gamma_o = \sigma(W_o[a^{< t-1>}, x^{< t>}] + b_o)$$

$$a^{< t>} = c^{< t>} \qquad \qquad c^{< t>} = \Gamma_u * \tilde{c}^{< t>} + \Gamma_f * c^{< t-1>}$$

$$a^{< t>} = \Gamma_o * \tanh c^{< t>}$$

From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to _____ and ____ in the GRU. What should go in the blanks?

- $igotimes \Gamma_u$ and $1-\Gamma_u$
- $\bigcap \Gamma_u$ and Γ_r
- $\bigcirc 1 \Gamma_u$ and Γ_u
- $\bigcap \Gamma_r$ and Γ_u
 - **⊘** Correct

Yes, correct!

10.	True/False: You would use unidirectional RNN if you were building a model map to show how your mood is heavily dependent on the current and past few days' weather.
	○ False
	True
	Correct Your mood is contingent on the current and past few days' weather, not on the current, past, AND future days' weather.
